### SUMMARY

---

**Full-stack Software Engineer** with 4+ years building production systems that handle complex transactional workflows for enterprise users. Background spanning design, product marketing, and engineering gives me an uncommon lens on trade-offs: I care as much about the experience at the interface as I do about the correctness of the system underneath.

At adHub, I owned the full lifecycle of a client-facing order platform that became the primary working surface for 1,000+ enterprise clients. I re-modelled a fragile, shared order workflow as an explicit finite-state machine, enforcing valid state transitions across product lines and recovering auditability that years of legacy code had eroded. Currently completing an MS in Computer Science focused on LLM systems, building agentic pipelines and RAG architectures.

### EXPERIENCE

---

#### **adHub Inc. (Digital Marketing Agency)**

*adHub is Taiwan's leading marketing agency focused on SMB. Having official partnerships with Meta and Google, adHub helps clients scale and optimise their marketing strategies.*

#### **Senior Software Engineer; Jul 2021 - Oct 2025** *(Promoted to Senior, Aug 2024)*

React, Laravel(PHP), Material UI, SQLServer, REST APIs

- Built a client-facing order management platform (React + Laravel) serving 1,000+ enterprise clients, modelling complex business logic across diverse product catalogues; reduced manual transaction handling by 90% and became the daily working surface for client-side operations.
- Re-architected a shared order lifecycle used across multiple product lines as a finite-state machine approach, enforcing explicit state transitions per product line and eliminating ambiguous bypasses accumulated over years of legacy code.
- Led comprehensive UX/UI redesign and frontend standardisation, architecting a reusable shared component layer that reduced redundant development by 30% and lifted user satisfaction scores by 45%.
- Instrumented user interactions with SQL-based analytics, creating a feedback loop that grounded product decisions in real usage data and cut requirement-to-implementation time by 20%.
- Migrated legacy React state management to Context API and modern hooks-based patterns, removing prop-drilling across the component tree, simplifying component structure and shortening onboarding ramp for new engineers.
- Mentored 3 engineers and established standardised code review and onboarding practices, improving team code consistency and reducing time-to-productivity for new hires.

#### **Product Marketing Manager; Dec 2017 - Jul 2021**

Marketing Strategy, Meta Ads, Google Ads, Google Analytics, MarTech Tools

- Directed data-driven digital campaigns using Meta Ads, Google Ads, and Google Analytics, reaching 10,000+ potential customers and building a working habit of decision-making from data.
- Built and maintained responsive marketing websites independently using WordPress, taking full ownership of design, content, and deployment before formally transitioning into engineering.

- Distilled a complex programmatic buying strategy into a self-produced video case study for executive stakeholders, translating technical execution into a compelling narrative that secured the Golden Award for Best Programmatic Buying at the Digital Singularity Awards.

## EDUCATION

---

### MS in Computer Science, National Cheng Chi University; Sep 2025 – present

- **Key Module:** Web Search and Mining, Natural Language Processing, Robot/AI Interaction Design
- **Award:** Academic Achievement Awards (Autumn 2025 & Spring 2026)

### BFA in Design, National Taiwan Normal University; 2013 – 2017

- **Key Module:** Web Design (A+), Universal Design (A+), Service Design (A+), Statistics (A+)
- **Award:** Academic Achievement Awards (Autumn 2015 & Autumn 2016), Bronze Award in Product Design (University Department Exhibition, 2014)

## SKILL

---

- **Language:** JavaScript (ES6+), TypeScript, Python, PHP, SQL, Java
- **Frontend:** React, Redux, React Hook Form, React Router, HTML5, CSS3
- **Backend & Database:** Laravel, Node.js, SpringBoot, PostgreSQL, MySQL, SQLServer
- **DevOps & Workflow:** Docker, CI/CD, Git, Linux, Agile Development (Scrum)
- **AI System Engineering:** RAG Pipelines, pgvector/FAISS, Ollama, LLM Integration
- **Design & Research:** UX Research, UI Design, Figma, Human-Computer Interaction

## PROJECT

---

### Sunbird Software Inc. (NCCU Industry-Academia Partnership)

Java, SpringBoot, jOOQ, PostgreSQL, Integration Test

- Migrating legacy Hibernate HQL queries to jOOQ in a production DCIM platform, replacing a string-typed query layer with compile-time type-safe queries.
- Authored unit and integration tests covering the migration's critical query paths, validating type-safe equivalence with the legacy HQL implementation before production cutover.

### RAG-based QA System with Internal Tooling & Architecture Design

Python, Vector Search, LLM Orchestration, Docker

- Designed a highly scalable 3-chain router architecture capable of processing complex query patterns with explicit branching logic, operating as a reliable agentic workflow.
- Built internal observability tooling (Score Dashboard and Prompt Playground) to enable systematic A/B testing and debugging across retrieval configurations, cutting iteration cycles by 80%.
- Led a four-person team and introduced Agile practices (backlog, Kanban, sprint), scoping work tightly and shipping a working system on schedule.

[\[project detail\]](#)

### Human-AI-Interaction Research: Emotionally Intelligent Terminal Agent

Node.js, JavaScript, Human-AI-Interaction

- Conducted rigorous user research and interaction design to engineer a simulated command-line AI agent, demonstrating how emotional cues in terminal interfaces increase task engagement.
